

Shipping Performant 3rd Party JS Widgets

@chaddonohue

@ericclemmons

@poeticninja

Example

```
<div  
  data-my-widget="chat"  
  data-accent-color="#61dafb"  
  data-button-color="#cc7a6f"  
><script async defer src="https://path.to/widgets.js"></script></div>
```

Following

Replying to @slightlylate @AdamRackis and 2 others

Average SPA ships 420KB JS, spends 5s in startup (20-30% in parse), 10-15s to TTI. I wouldn't put a ratio on it (variance) but parse matters

Tools

- babel
- webpack
- <https://github.com/th0r/webpack-bundle-analyzer>

widgets.js

node_modules

(2.19MB)

Single **widgets.js** file served to users with *everything*.

webpack -p

(427KB)

- Automatically minifies using UglifyJS.
- Shims *process.env.NODE_ENV* = “*production*” for dead-code removal.
- <https://webpack.js.org/guides/production-build/#the-automatic-way>

compression-webpack-plugin

(134KB)

- Configurable, compressed bundles with Gzip.

```
49     plugins: [  
50         new CompressionPlugin({  
51             test: /\.(html|js)$/   
52         })  
53     ]
```

- <https://github.com/webpack-contrib/compression-webpack-plugin>

Tree Shaking (109kB)

- **babel-plugin-lodash**

```
1  {  
2    "plugins": [  
3  +   ["lodash", {  
4  +     "id": ["lodash", "recompose"]  
5  +   }],
```

- <https://github.com/lodash/babel-plugin-lodash>
- “Tree shaking” bundles the named imports vs. an entire CommonJS module.
- <https://webpack.js.org/guides/tree-shaking/>

Preact (71.2kB)

- **preact-compat** is a drop-in replacement for **react**
- Use **webpack's resolve.alias**:

```
20 + resolve: {  
21 +   alias: {  
22 +     react: "preact-compat",  
23 +     "react-dom": "preact-compat"  
24 +   }
```

Code Splitting

(31KB for widgets.js)

- Automatically splits dynamic **imports**

```
25      - const render = widgets[myWidget];
26      + // Attempt to import widget init script, or throw exception
27      + const render = await (async () => {
28      +     try {
29      +         const imported = await import(`./${myWidget}.js`);
30      +
31      +         // `import`ed code-split modules contain all exports
32      +         return imported.default;
33      +     } catch (e) {
34      +         // Friendly error message for invalid widget names
35      +         if (e.message.match("Cannot find module")) {
36      +             throw new Error(`Unknown data-my-widget: ${myWidget}`);
37      +         } else {
38      +             throw e;
39      +         }
40      +     }
41      + })();
```

Asset	Size	Chunks	Chunk Names
widgets.js	230 kB	0 [emitted]	widgets
widgets.js.map	92 bytes	0 [emitted]	widgets
widgets.js.gz	72.2 kB	[emitted]	

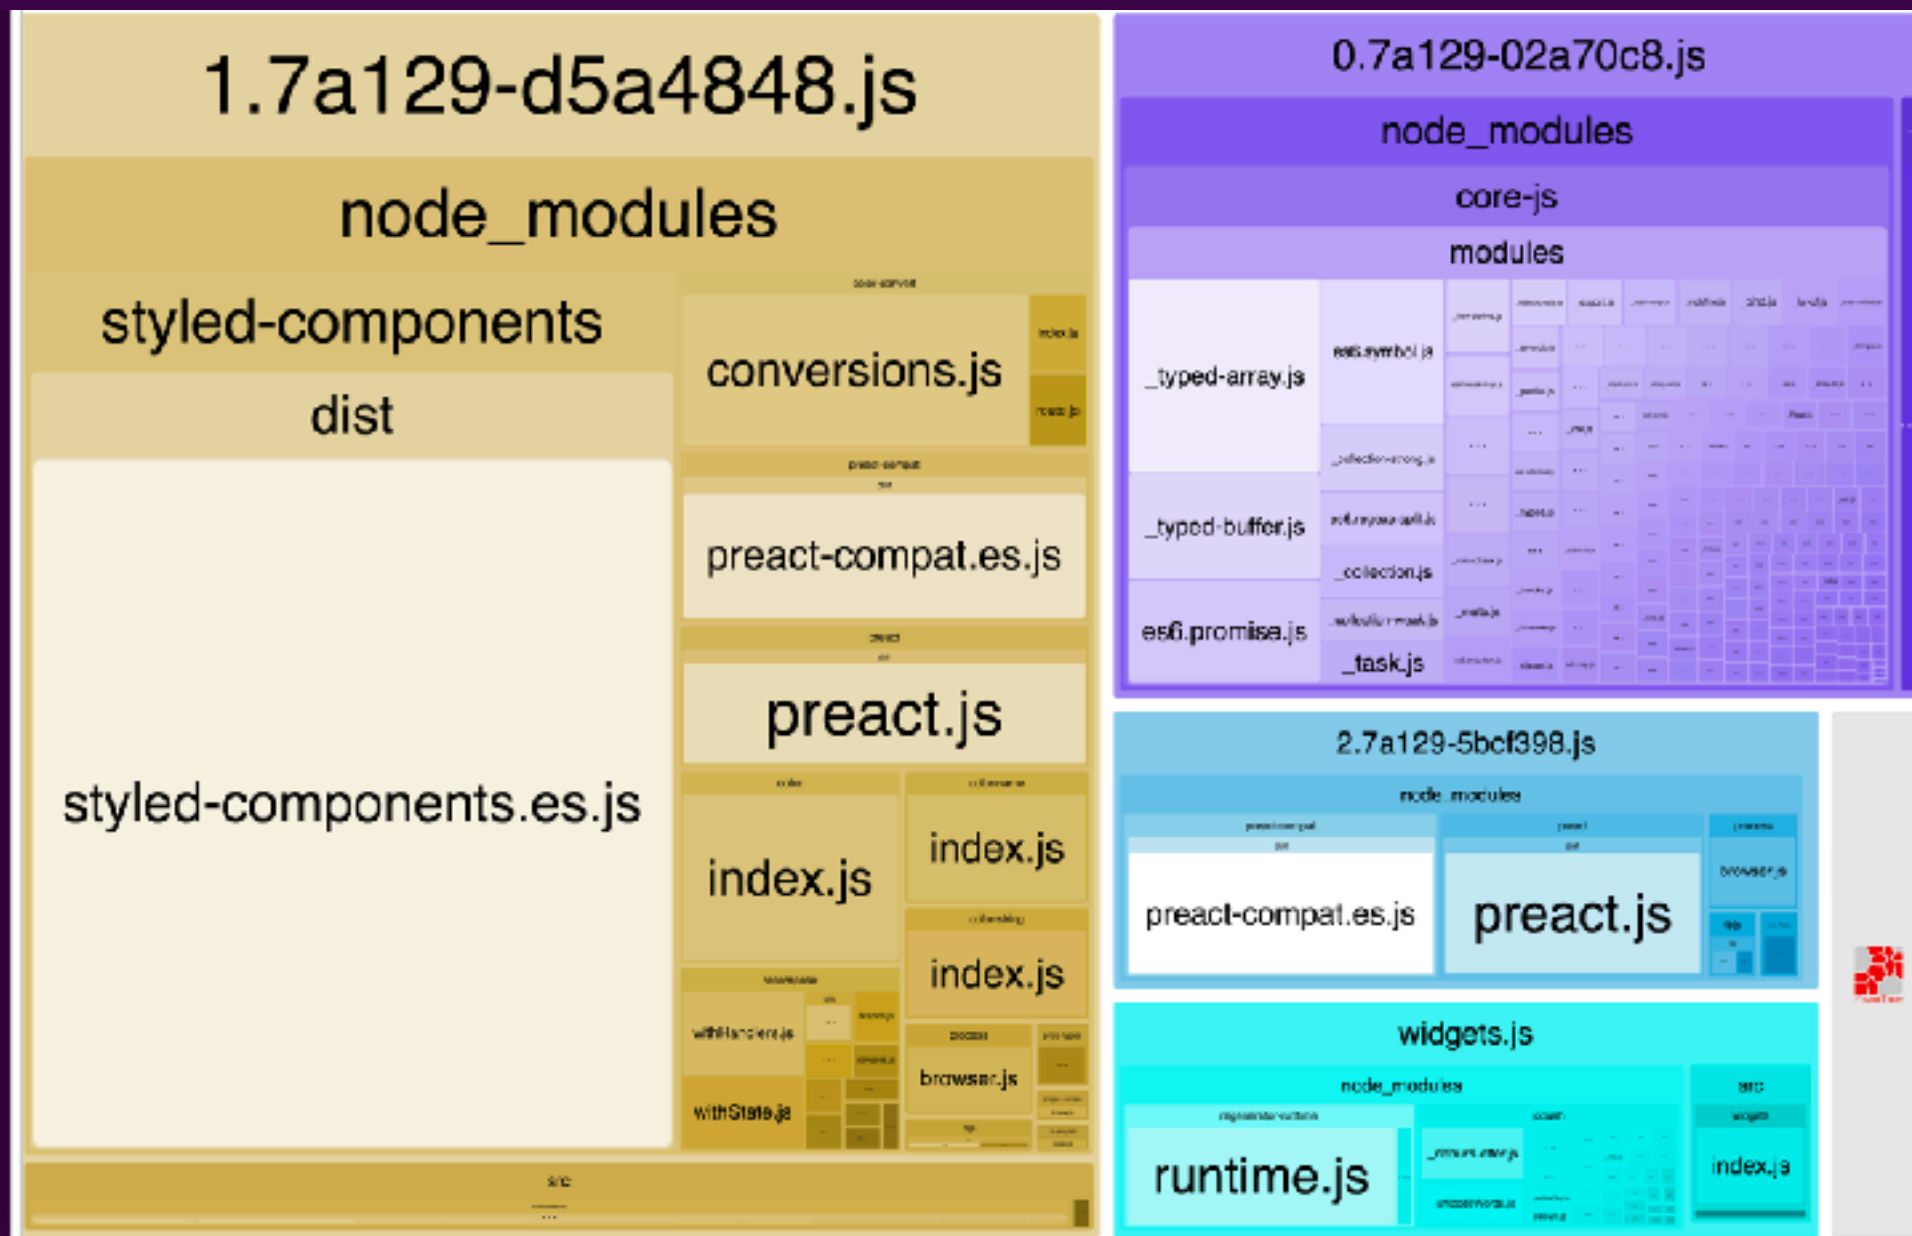

Asset	Size	Chunks	Chunk Names
0.f7f14-546e3d2.js	136 kB	0 [emitted]	
1.f7f14-642abe5.js	20.9 kB	1 [emitted]	
widgets.js	96.6 kB	2 [emitted]	widgets
0.f7f14-546e3d2.js.map	108 bytes	0 [emitted]	
1.f7f14-642abe5.js.map	108 bytes	1 [emitted]	
widgets.js.map	92 bytes	2 [emitted]	widgets
1.f7f14-642abe5.js.gz	7.82 kB	[emitted]	
widgets.js.gz	31.7 kB	[emitted]	
0.f7f14-546e3d2.js.gz	40.9 kB	[emitted]	

Targeted Polyfills

(6.54kB)

- Bundle & ship code to majority of your users based on their browser statistics.
- Lazy-load additional polyfills for uncommon browser targets.
- <https://github.com/zloirock/core-js>

chat.js (40.8kB)
hello.js (7.82kB)
polyfills.js (17kB)
widgets.js (6.54kB)

How to draw an owl

1.

2.

1. Draw some circles

2. Draw the rest of the fucking owl

styled-components

- Popular CSS-in-JS solution for dynamic styles
- **21kB**
- Significant effort to convert to alternatives.
- (11kB in savings with **styled-jsx**)

color

- Popular color manipulation library.
- **8kB**
- **polychrome** (2kB) is nearly a drop-in replacement.
- (6kB in savings)

setState

- State management libraries can add bloat.
- React's **setState** can solve for most isolated state management needs.
- (3kB in savings)

Thanks!
